1. Preface

SQ713x supports many hardware cryptographic accelerators: embedded high-quality TRNG (True Random Number Generator), SHA-256, asymmetric encryption ECC-256, and symmetric encryption AES-128/AES-256. It also has secure storage for ECC and AES keys storage.

The device is suitable for building high-security applications, such as IoT symmetric/asymmetric authentication, attestation, TLS1.2/1.3 secure connections, secure boot, secure OTA, and F/W protection, etc.

Secure storage for ECC and AES keys:

3. Electrical Characteristics

3.1 Absolute Maximum Rating

The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Bus Timeout ⁴	tTIMEOUT	Input	65	-	-	ms

Note 1: Direction is with respect to SQ713x device. Input is from Master to SQ713x, Output is from SQ713x to Master.

Note 2: Bit Timing: tSTART, tLOW, tHIGH, and tBIT are designed to be compatible with a standard UART baud rate at 230.4 kbps. The UART is set to one start bit, eight data bits, no parity and one Stop bit.

Note 3: Turnaround time: SQ713x will initiate the first output low going transition after this time interval following the initial falling edge of the start pulse of the last bit of the transmit flag. After SQ713x transmits the last bit of a group, system must wait this interval before sending the first bit of a flag. It is measured from the falling edge of the start pulse of the last bit transmitted by SQ713x.

Note 4: Bus Timeout: SQ713x devices will wait for a Wake Token if the bus is inactive longer than this duration.
